## Job market Paper

**"No Kid is An Island: Intergenerational Mobility and Peer Effects"**

Economic inequalities persist from one generation to the next. How much of this transmission is due to differences in peer exposure? Exploiting within school across cohort exogenous variation in schoolmates' parental background among Danish high school students, I show that a \$1 increase in average schoolmates' parental earnings results in a \$0.08 increase in adult earnings. This effect is as large as 30% of the parent-child correlation in earnings. I find that former schoolmates are connected on labor market networks: they join their peers' firms and leverage school connections as outside options to secure higher wages, effectively benefiting from advantages inherited by their peers from their parents.
